

ASGARD

Brain & Arsenal.

The work, the proof,
and what comes next.

New brain release: not yet deployed

Prepared for Rayan • Original realms preserved

Here is what is actually live.

WRITTEN + TESTED

Implementation through Wave 9. Streaming, compatibility, memory and voice safeguards, new tools and tests.

PUSHED TO MAIN

The tested implementation is on GitHub at 3b42c7a. A push is saved code, not a deployment.

LIVE + VERIFIED

The earlier Floating Realms release remains live. No brain wave has been rolled out.

Live release: floating-761d8ca5ef4f • 25 asset hashes checked on both hosts

The waiting happened in layers.

Chat waited

The page waited for the whole reply before showing words.

Voice waited

Speech waited for the complete audio file before playback.

Context kept changing

Keyword-based tool lists prevented a consistent cached prefix.

Tests had side effects

Smoke requests could consume approvals and write conversation state.

The model was already Sonnet 5. Changing the model is not a result of this pass.

Words can arrive progressively.

Progressive text

Partial words appear before the final completed-reply receipt.

Cancellation

A stopped stream cannot append a late completed answer.

Failure handling

Bounded retries; clear provider failures; no replay of a partial reply.

Existing behavior

Legacy reply callers, permission gates and rendered realms remain supported.

Five Chrome checks passed using controlled replies. Live speed is still unmeasured.

Fewer extra calls. Clearer boundaries.

Inline delegation

A councillor gets a narrow task scope within the current turn. No separate councillor model starts.

Hall delivery

Queued research can return to the conversation inbox. No Telegram test message was sent.

Structured memory

Facts replace older values and carry timestamps. Repeated facts avoid duplicate writes.

Controlled activation

New memory and conversation-copy switches remain off. Old memory was not deleted.

Queued-job crash recovery, simultaneous writes and live recall still need acceptance tests.

The new voice path is built.

Implemented

Persistent speech connection, progressive audio, heard-text receipts and cancellation.

Corrected

New replies stop old playback. Late microphone permission cannot turn a disabled mic back on.

Not yet proven

Actual delay, speaker echo and heard-word accuracy on your Chromebook.

Streaming voice stays off. Existing speech fallback now handles network errors too.

Seven ways to gather context.

Current context · Today · Around here	Three combined readers for time, tasks, calendar, weather and alerts.
Document conversion	Reuses the existing converter. New entry stays off until allowance is verified.
Image text recognition	OCR.space adapter built; key and allowance needed.
Firecrawl search · Exa search	Both adapters built; keys and free-credit verification needed. Both off.

Tool names: util_context, plan_today, world_here, doc_to_markdown, doc_ocr, web_firecrawl_search, web_exa_search

Six public-data readers.

SEC filings · Company figures

Recent filings and reported financial facts. Contact header still needed.

Federal debt

Treasury adapter returned real data. This is debt, not a yield curve.

Economic indicators

FRED adapter built; free key needed.

Food recalls · Medicine labels

Both FDA adapters returned real data from the development machine.

[money_filings](#) · [money_fundamentals](#) · [money_treasury](#) · [money_macro](#) · [world_recalls](#) · [world_drug_lookup](#)

Five ways to check the facts.

Repository activity · Workflow results

Both GitHub readers returned real responses; this repository has no workflow runs.

ASGARD self-check

Checks homepage, expected release and browser heartbeat. Cron stays off; no notification send.

Scholarly works

OpenAlex adapter returned real research results.

Medical research links

PubMed adapter returned article identifiers and source links.

dev_repo_status · dev_actions_status · dev_self_check · util_openalex · util_pubmed

Five optional capabilities.

Movie lookup

TMDB adapter built; read token and accepted terms needed.

Audio transcription

AssemblyAI submit/status adapter built; key and allowance needed. Off.

Public cloud reading · Screenshots

Separate from your logged-in Chrome. Scoped token and quota checks needed. Off.

Phone notifications

Reuses ntfy. Requires your explicit enable switch and a secret topic. Off.

media_movie_lookup · media_transcribe · browser_cloud_read · browser_cloud_screenshot · comms_push

The checks that actually passed.

148

automated tests

5

Chrome fixture checks

7

real public-data adapters

Worker build

A local Cloudflare build completed with existing bindings preserved.

Catalog

300 total backend entries; 246 public entries. Existing tools and proposals are not counted as new features.

Live site

25 asset hashes and content types checked on the actual host and the legacy forwarding host.

Offline tests and public API checks do not prove live assistant speed or speech quality.

Storage is the measured pressure point.

1,833

ASGARD writes on September 7 UTC

The Free allowance is 1,000 per day.

Billing access still needs to confirm your current plan.

Daily writes

1,833 measured

1,000 Free allowance

If currently Free, \$5/month is a reasonable recommendation. It includes 1 million writes/month; extra writes can cost more.

No invented “10× faster” claim.

First word · First sound	Before/after measurements are unavailable. The provider reported insufficient balance.
Tokens · Cache hit rate	Unmeasured. The free token-count endpoint also rejected the account balance.
Processing time	Existing mixed traffic: median 1.278 ms, 99th percentile 66.518 ms. This is not chat or voice latency.
Release gate	Missing timing or provider-search evidence blocks the release checks.

60 authored selection prompts + 45 persona prompts are ready; no live scores have been manufactured.

The smallest steps to unlock it.

1 · Model testing

Authorize a small credit allowance; decide about funding if the account is empty.

2 · Gateway access

Provide scoped AI Gateway management access so its spend limit can be set first.

3 · Device acceptance

Reconnect the Chrome companion and test the Chromebook microphone and speakers.

4 · Safe release sequence

One wave at a time: record old version → 10% → watch 5 minutes → 100% → verify.

Conversation copying then needs seven full days. Old KV deletion remains your separate decision.

Your safety net stayed in place.

Preserved

Halls, artwork, CSS, original checkout, existing memory and all five historical paper-trader IDs.

Kept off

New paid services, phone notifications, streaming voice, structured-memory activation and conversation migration.

Deferred

Programmatic tool execution, new MCP federation, Agents SDK migration and speech-to-speech.

No invented coverage

No promised free package tracking, flight status, local gas prices or outage API.

Jina redirect checks, FMP entitlements, AirNow replacement, Transitland and Podcast Index remain unresolved.

Make it reliable before expanding.

First: finish the evidence

Measure live replies and speech, then roll out each wave safely.

Then: survive interrupted jobs

Give queued research durable recovery without adding a second scheduler.

Then: show connection health

A future release/extension health indicator could make outages obvious.

Later: connect the assistants

Permissioned collaboration with JARVIS and KEVOS, with explicit approval for real messages.

Least certain: real speaker echo, heard-word timing, model tool-search compatibility and concurrent history writes.

The work is saved. *The rollout is still open.*

The report names what was built,
what was tested and what remains blocked.

148 passing tests · 23 added tool entries · 0 brain deployments
